Excerpt from Philosophical Transactions of the Royal Society of London, Vol. 119: For the Year 1829 Part 1 The acids should be allowed to digest three or four days, with a heat which ought gradually to be raised. The solution, being then poured off, should he suffered to stand until a quantity of fine pulvulent ore of iridium, suspended in the liquid, has completely subsided and should then be mixed with 41 parts of sal ammoniac, dissolved in about 5 times their weight of water. The first precipitate, which will thus be obtained, will weigh about 165 parts, and will yield about 66 parts of pure platina. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books. Find more at www.forgottenbooks.com This book is a reproduction of an important historical work. Forgotten Books uses state-of-the-art technology to digitally reconstruct the work, preserving the original format whilst repairing imperfections present in the aged copy. In rare cases, an imperfection in the original, such as a blemish or missing page, may be replicated in our edition. We do, however, repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works.
